

Contents

Preface	ix
Contributors	xi
1. Introduction	
<i>Krishna R. Dronamraju</i>	
1. The Haldane Hypothesis	2
2. Glucose-6-Phosphate Dehydrogenase Deficiency and Malarial Resistance ...	5
3. Phagocytosis of Ring Forms	6
4. Evolutionary Considerations: Malaria's Eve Hypothesis	6
5. Malaria Vaccines	8
References	10
2. J.B.S. Haldane (1892–1964)	
<i>Krishna R. Dronamraju</i>	
1. Population Genetics	16
2. Beanbag Genetics	17
3. Terminology	17
4. Human Genetics	18
5. Genetic Load Theory	19
6. Immunogenetics	19
7. Sociobiology	21
8. Daedalus and Eugenics	21
References	22
3. Removal of Early Parasite Forms from Circulation as a Mechanism of Resistance Against Malaria in Widespread Red Blood Cell Mutations	
<i>Paolo Arese, Kodjo Ayi, Aleksei Skorokhod and Franco Turrini</i>	
1. Introduction	25
2. Malaria is Responsible for High Frequency and Regional Distribution of Major Protective RBC Mutations: Geographical Evidence	27
3. Epidemiological Evidence: Degree of Protection Afforded by RBC Mutations	29
3.1. Hemoglobin AS (Sickle-Cell Trait)	29
3.2. Thalassemias	29
3.3. Hemoglobin C	30
3.4. Hemoglobin E	30

3.5. Glucose-6-Phosphate Dehydrogenase	31
3.6. Southeast Asian Ovalocytosis	32
4. A Critical Assessment of the Current Mechanism of Protection by Widespread RBC Mutations	32
4.1. Sickle-Cell Anemia	36
4.2. Beta-Thalassemia	36
4.3. Alpha-Thalassemia	37
4.4. Glucose-6-Phosphate Dehydrogenase Deficiency	38
5. Modifications in the RBC Membrane Elicited by the Developing Parasite Induce Phagocytosis	39
5.1. Similarity of Ring Phagocytosis to Phagocytosis of Normal Senescent or Oxidatively Stressed RBCs	39
6. Enhanced Phagocytosis of Ring Forms as a Model of Protection for Widespread RBC Mutations	41
6.1. Membrane Binding of Hemichromes, Autologous IgG, Complement C3c Fragment; Aggregated Band 3 and Phagocytosis in Nonparasitized and Ring-Parasitized Normal and Mutant RBCs	41
6.2. Why are Rings Developing in Beta-Thalassemia, Sickle-Cell Trait, HbH, and G6PD-deficient RBCs Phagocytosed More Intensely than Rings Developing in Normal RBCs?	43
6.3. What is the Evidence that Ring-Parasitized Mutant RBCs are Also Preferentially Removed <i>In Vivo</i> ?	45
6.4. Why is Preferential Removal of Ring-Forms Advantageous to the Host?	46
6.5. Why are Rings Developing in Alpha-Thalassemia Very Similar to Controls?	46
7. Conclusions	48
References	50

4. Clinical, Epidemiological, and Genetic Investigations on Thalassemia and Malaria in Italy

Stefano Canali and Gilberto Corbellini

1. The Evolution of the Knowledge of Thalassemia Genetics: The Italian Contribution	56
2. Early Observations on the Association between Malaria and Thalassemia	58
3. Collaboration of Silvestroni and Bianco with Montalenti: At Work on Haldane's Hypothesis	63
4. Research of Carcassi <i>et al.</i>	68
5. Studies on Microcythemia Genetics in Italy Funded by the Rockefeller Foundation	69
6. The Results of Siniscalco's Genetic Studies on the Distribution of Thalassemia, G-6-PD Deficit, and of Malaria	74
7. The Malaria Hypothesis and the Consequences of Eradicating the Plasmodia and of Thalassemia Prevention	75
8. Conclusions	76
Acknowledgements	77
References	77

5. Resistance to Antimalarial Drugs: Parasite and Host Genetic Factors

Rajeev K. Mehlotra and Peter A. Zimmerman

1. Introduction	81
2. Malaria	82
3. Antimalarial Chemotherapy and Chemoprophylaxis	83
3.1. Drugs Available for Treatment of Malaria	83
4. Antimalarial Drug Resistance	86
4.1. Current Status of Drug-Resistant Malaria	86
4.2. Parasite Genetic Polymorphism As a Basis for Antimalarial Resistance	89
4.3. Genes Associated with Chloroquine Resistance in <i>P. falciparum</i>	90
4.4. Mechanism of Resistance to Antifolate Combination Drugs in <i>P. falciparum</i>	93
4.5. Mechanism of Atovaquone Resistance in <i>P. falciparum</i>	94
4.6. Mechanisms of Drug Resistance in <i>P. vivax</i>	95
5. Human Drug Metabolism	96
5.1. Cytochrome P450 Enzyme Superfamily	96
5.2. Uridine Diphosphate Glucuronosyltransferase Enzyme Superfamily	98
5.3. Antimalarial Drug Metabolism	100
5.4. Antimalarial Drug Levels and Treatment Outcome	104
6. Conclusions	109
Acknowledgments	110
References	110

6. Evolutionary Origins of Human Malaria Parasites

Stephen M. Rich and Francisco J. Ayala

1. The Phylum Apicomplexa	125
2. The Genus <i>Plasmodium</i>	127
3. Transfers Between Human and Monkey Hosts	132
4. Population Structure of <i>Plasmodium falciparum</i>	135
5. Malaria's Eve Hypothesis	137
6. Malaria's Eve Counterarguments	140
Appendix	142
References	143

7. Vector Genetics in Malaria Control

V.P. Sharma

Abstract	147
1. Introduction	147
2. The <i>Anopheles culicifacies</i> Complex	149
2.1. Paradox Resolved	154
3. Application in Malaria Control	156
3.1. Stratification	157
3.2. Insecticide Resistance	158
3.3. Bioenvironmental Malaria Control	162
Acknowledgments	164
References	165

8. The Rate of Mutation of Human Genes	169
<i>J.B.S. Haldane</i>	
9. Disease and Evolution	175
<i>J.B.S. Haldane</i>	
Index	189
