CONTENTS

An overview of data analysis methods in geomatics 1
A. Dermanis, F. Sansò, A. Grün

Data analysis methods in geodesy 17
A. Dermanis and R. Rummel

1. Introduction 17
2. The art of modeling 19
3. Parameter estimation as an inverse problem 24
   3.1. The general case: Overdetermined and underdetermined system without full rank ($r<\min(n,m)$) 29
   3.2. The regular case ($r=m=n$) 39
   3.3. The full-rank overdetermined case ($r=m<n$) 40
   3.4. The full-rank underdetermined case ($r=n<m$) 41
   3.5. The hybrid solution (Tikhonov regularization) 43
   3.6. The full rank factorization 46
4. The statistical approach to parameter determination: Estimation and prediction 47
5. From finite to infinite-dimensional models (or from discrete to continuous models) 53
   5.1. Continuous observations without errors 58
   5.2. Discrete observations affected by noise 65
   5.3. The stochastic approach 73
6. Beyond the standard formulation: Two examples from satellite geodesy 75
   6.1. Determination of gravity potential coefficients 75
   6.2. GPS observations and integer unknowns 78

Appendix A: The Singular Value Decomposition 86

Linear and nonlinear inverse problems 93
R. Snieder and J. Trampert

1. Introduction 93
2. Solving finite linear systems of equations 96
   2.1. Linear model estimation 96
   2.2. Least-squares estimation 99
   2.3. Minimum norm estimation 100
   2.4. Mixed determined problems 102
   2.5. The consistency problem for the least-squares solution 103
   2.6. The consistency problem for the minimum-norm solution 106
   2.7. The need for a more general regularization 108
   2.8. The transformation rules for the weight matrices 110
   2.9. Solving the system of linear equations 112
      2.9.1. Singular value decomposition 113

2.9.2. Iterative least-squares ... 117
3. Linear inverse problems with continuous models ... 120
3.1. Continuous models and basis functions ... 122
3.2. Spectral leakage, the problem ... 123
3.3. Spectral leakage, the cure ... 127
3.4. Spectral leakage and global tomography ... 129
4. The single scattering approximation and linearized waveform inversion ... 131
4.1. The Born approximation ... 131
4.2. Inversion and migration ... 133
4.3. The Born approximation for transmission data ... 136
4.4. Surface wave inversion of the structure under North-America ... 139
5. Rayleigh's principle and perturbed eigenfrequencies ... 141
5.1. Rayleigh-Schrödinger perturbation theory ... 141
5.2. The phase velocity perturbation of Love waves ... 143
6. Fermat's theorem and seismic tomography ... 145
6.1. Fermat's theorem, the eikonal equation and seismic tomography ... 146
6.2. Surface wave tomography ... 148
7. Nonlinearity and ill-posedness ... 150
7.1. Example 1: Non-linearity and the inverse problem for the Schrödinger equation ... 151
7.2. Example 2: Non-linearity and seismic tomography ... 153
8. Model appraisal for nonlinear inverse problems ... 155
8.1. Nonlinear Backus-Gilbert theory ... 155
8.2. Generation of populations of models that fit the data ... 157
8.3. Using different inversion methods ... 159
9. Epilogue ... 159
References ... 160

Image Preprocessing for Feature Extraction in Digital Intensity, Color and Range Images ... 165

W. Förstner

1. Motivation ... 165
2. The image model ... 167
2.1. Intensity images ... 168
2.2. Color images ... 169
2.3. Range images ... 169
3. Noise variance estimation ... 171
3.1. Estimation of the noise variance in intensity images ... 172
3.2. Noise estimation in range images ... 175
4. Variance equalization ... 176
4.1. Principle ... 176
4.2. Linear variance function ... 177
4.3. General variance function ... 177
5. Information preserving filtering ... 177
5.1. The Wiener filter ... 177
5.2. Approximation of the auto covariance function ... 178
5.3. An adaptive Wiener filter for intensity images ... 179
5.4. An adaptive Wiener filter for range images ... 181
6. Fusing channels: Extraction of linear features ... 182

6.1. Detecting edge pixels 182
6.2. Localizing edge pixels 187
7. Outlook 187

Optimization-Based Approaches to Feature Extraction from Aerial Images 190
P. Fua, A. Gruen and H. Li

1. Introduction 190
2. Dynamic programming 191
2.1. Generic road model 192
2.2. Road delineation 193
3. Model based optimization 196
3.1. Generalized snakes 198
3.2. Enforcing consistency 209
3.3. Consistent site modeling 212
4. LSB-snakes 215
4.1. Photometric observation equations 215
4.2. Geometric observation equations 218
4.3. Solution of LSB-snakes 219
4.4. LSB-snakes with multiple images 220
4.5. Road extraction experiments 222
5. Conclusion 225

Diffraction tomography through phase back-projection 229
S. Valle, F. Rocca and L. Zanzi

1. Introduction 229
2. Born approximation and Fourier diffraction theorem 231
3. Diffraction tomography through phase back-projection 235
3.1. Theory 235
4. Diffraction tomography and pre-stack migration 239
4.1. Diffraction tomography wavepath 239
4.2. Migration wavepath 241
4.3. Diffraction tomography and migration: wavepath and inversion process comparison 245
5. Numerical and experimental results 246
5.1. Data pre-processing 246
5.2. Numerical examples 247
5.3. Laboratory model and real case examples 248
Appendix A: The Green Functions 253
Appendix B: Implementation details 254
Appendix C: DT inversion including the source/receiver directivity function 254
